

Cover image: I pictured stressed neurons as a watercolour painting, still beautiful and graceful, but with blurred outline and one short step from fading. Our team researched the right colour to keep the painted neurons alive and found CDFN to be a promising agent against ER stress induced cell death. Image created using Craiyon v3, an AI image generator. Based on the article 'CDFN rescues motor neurons in models of amyotrophic lateral sclerosis by targeting endoplasmic reticulum stress' by Voutilainen et al. Pp. 3783–99.
